Structuring Knowledge For Clinical Decision Support

Richard N. Shiffman, MD, MCIS

Professor of Pediatrics

Assoc. Director, Yale Center for Medical Informatics

June 3, 2010

GLIDES Project – Years 1-2 (GuideLines Into DEcision Support)

Partnership with YSM, YNHH, and Nemours

Creating and refining tools for guideline knowledge translation

Completed 2 years of contracted activities

- Applied Guideline Elements Model to extract knowledge from current guidelines

- Implemented decision support for *chronic management of asthma* and *prevention of obesity* within Centricity and EPIC EHRs

- Currently evaluating use and iteratively refining CDS

GLIDES Project – Year 3

New *Implementation* partnerships with:

Geisinger

Children's Hospital of Philadelphia

New *Developer* partnerships with:

American Academy of Pediatrics

American Academy of Otolaryngology-Head & Neck Surgery

ECRI Institute

Human Factors Engineer and Cognitive Psychologist

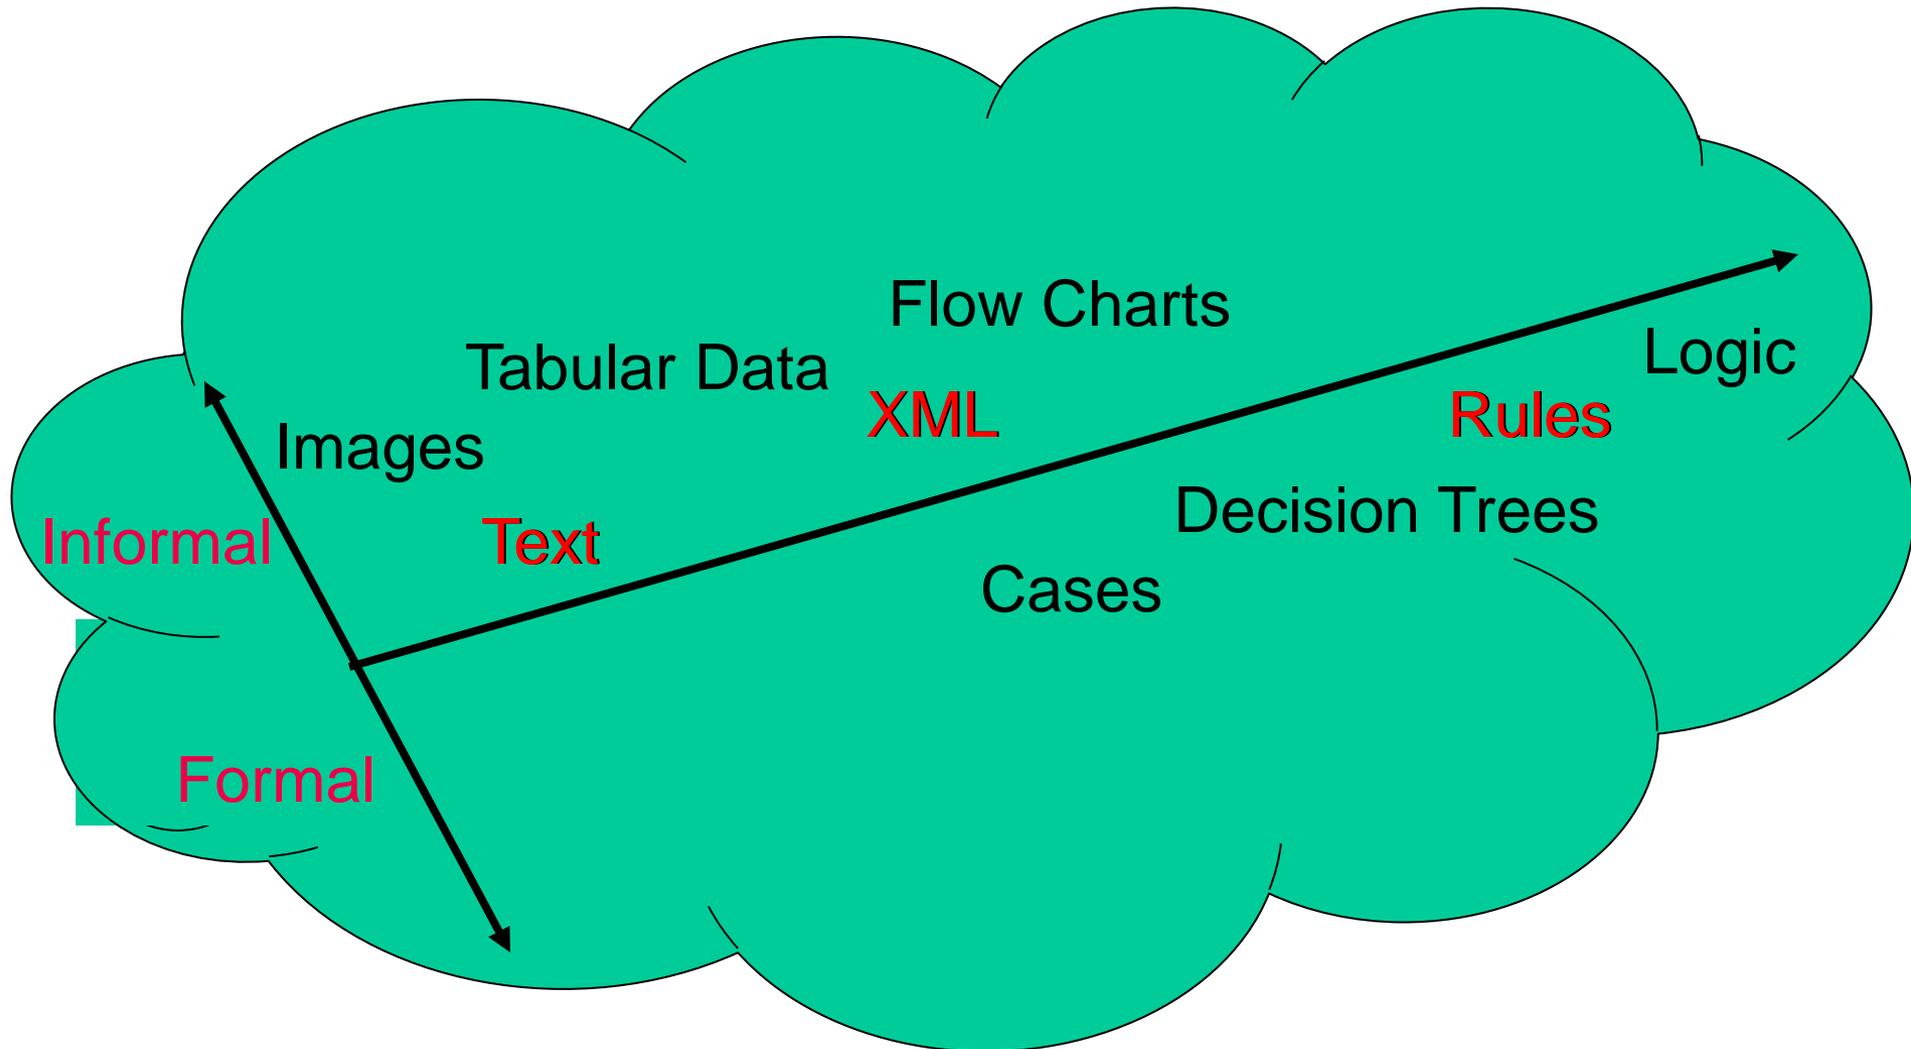

Goal: **Systematic and Replicable**

Fundamental problem: “Structuring Knowledge”

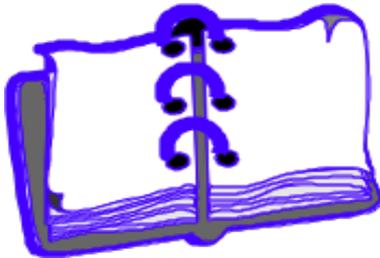

- New knowledge becomes available in original research reports, systematic reviews, meta-analyses, expert experience
- Guideline authors “digest” knowledge and make specific recommendations about how it should be applied
- Must be “formalized” to be useful to CDS implementers (to give something a proper form)

The Knowledge Formalization Continuum

Baumeister. CEUR-WS 2009

Challenge of Representing Guideline Knowledge Electronically

Logical Analysis with Highlighters

If patient adherence, inhaler technique, and environmental control measures are adequate, and asthma is not well controlled, a step-up in treatment may be needed. (Evidence quality B-extrapolated)

XML: From a small number of discrete colors to an unlimited palette

XML

- Multi-platform, Web-based, open standard
- Meaningfully-named “tags” **enclose** and **describe** text
`<inclusion.criterion>hematuria</inclusion.criterion>`
-

GEM

Set of >100 tags designed to represent concepts used in clinical guidelines

Markup can be performed by non-programmers

Human-readable, yet can be processed by machine

GEM DTD adopted as ANSI standard (ASTM E2210-02)

GEM II Schema adopted as ANSI standard (E2210-06)

GEM Cutter

The screenshot displays the GEM Cutter III software interface for a project named 'AOE_GC3'. The main window is divided into several sections:

- Project View (Left):** Shows the document's metadata and content. The title is 'AAO-HNS Acute Otitis Externa Clinical Practice Guideline', version 3.0, dated September 12, 2005. It lists the 'Acute Otitis Externa Guideline Development Group Members' and their professional backgrounds. A 'Conflict of Interest Disclosure' section states that Alcon Laboratories provided an unrestricted educational grant to the American Academy of Otolaryngology — Head and Neck Surgery (AAO-HNS) for creating the guideline. An 'Abstract' section begins with 'This guideline provides evidence-based recommendations on managing diffuse acute otitis externa (AOE) defined as diffuse inflammation or infection of the external ear canal which...'
- Navigation (Top):** Includes a 'Find' search bar and a set of navigation icons (back, forward, search, etc.).
- Document Structure (Center):** A tree view showing the document's XML structure. The root is '<GuidelineDocument>', followed by '<Identity>' and '<GuidelineTitle> AAO-HNS Acute Otitis Externa Clinical Practice'. Other elements include '<Citation>', '<ReleaseDate>', '<Availability>', '<Status>', '<CompanionDocument>', '<Adaptation>', '<StructuredAbstract>', '<Developer>', '<Purpose>', '<IntendedAudience>', '<MethodOfDevelopment>', '<TargetPopulation>', '<KnowledgeComponents>', '<Testing>', '<RevisionPlan>', and '<ImplementationPlan>'. A red circle highlights the navigation icons, and another red circle highlights the document structure tree.
- Guideline Properties (Right):** A panel for editing the '<GuidelineTitle>'. It contains a text input field with the value 'test', radio buttons for 'N/D', 'Explicit' (selected), and 'Inferred', and a label 'Complete title of the guideline'.

XML-Tagged Recommendation

<decision_variable> patient adherence

<value> adequate </value> </decision_variable>

<decision_variable> inhaler technique

<value> adequate </value> </decision_variable>

<decision_variable> environmental control measures

<value> adequate </value> </decision_variable>

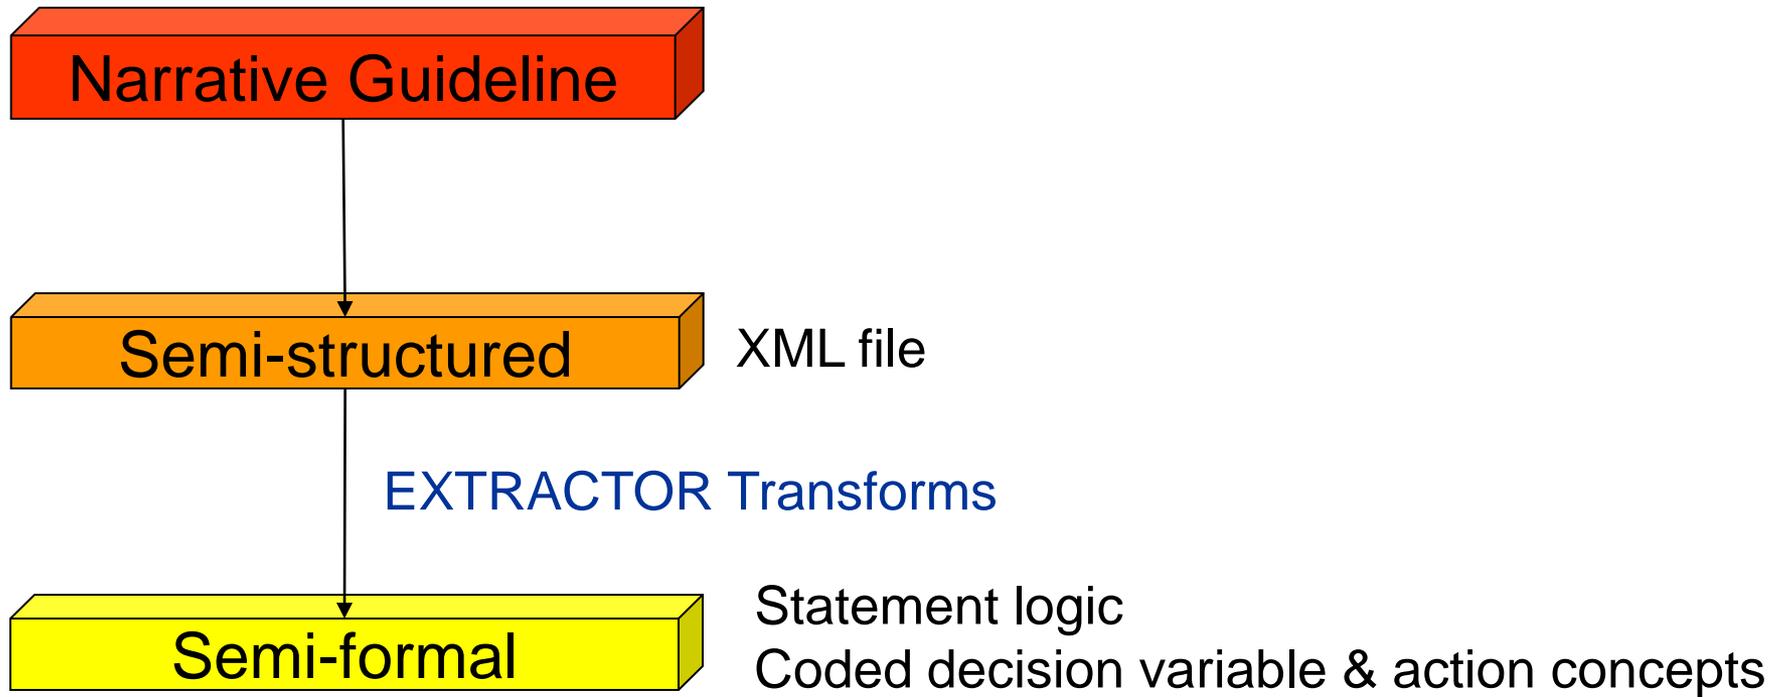

<decision_variable> asthma control

<value> not well-controlled </value> </decision_variable>

<action> a step up in treatment may be needed </action>

<evidence_quality> B—extrapolated </evidence_quality>

BRIDGE-Wiz

Building Recommendations in a Developer's Guideline Editor

- Formalizes a process for writing implementable recommendations

- Incorporates prompts to improve guideline quality

- Controlled natural language

 - Offers verb choices based on action-type

 - Traps and disallows use of “consider”

 - Discourages “statement of fact”

- Requires systematic appraisal of evidence quality and benefit-harms

 - Suggests appropriate obligation term (deontic modal)

- Output includes a high-level “rule” and an evidence profile

Agency for Healthcare Research and Quality
Advancing Excellence in Health Care

Summary

Systematic and replicable process for formalization of guideline knowledge

- Markup guideline document into (ANSI standard) GEM

- Manipulate and display components with XSLT transforms

- (Does not require knowledge engineers at each step)

Upstream: facilitate development of “actionable” recommendations
